

@Component with @Profile

Yes, `@Profile` annotation can be used together with `@Component` on top of class representing spring bean.

If, class annotated with `@Component` does not have `@Profile`, that means that this bean will exist in all profiles.

You can specify one, multiple profiles, or profile in which bean should not exist:

```
@Profile("database")  
@Profile("!prod")  
@Profile({"database", "file"})
```
